

MOC3051M, MOC3052M

6-Pin DIP Random-Phase Optoisolators Triac Drivers (600 Volt Peak)

Features

- Excellent I_{FT} stability—IR emitting diode has low degradation
- High isolation voltage—minimum 7500 peak VAC
- Underwriters Laboratory (UL) recognized—File #E90700, Volume 2
- 600V peak blocking voltage
- IEC60747-5-2 approved (File #94766)
 - Ordering option V (e.g. MOC3052VM)

Applications

- Solenoid/valve controls
- Lamp ballasts
- Static AC power switch
- Interfacing microprocessors to 115 and 240 Vac peripherals
- Solid state relay
- Incandescent lamp dimmers
- Temperature controls
- Motor controls

Description

The MOC3051M and MOC3052M consist of a AlGaAs infrared emitting diode optically coupled to a non-zero-crossing silicon bilateral AC switch (triac). These devices isolate low voltage logic from 115 and 240 Vac lines to provide random phase control of high current triacs or thyristors. These devices feature greatly enhanced static dv/dt capability to ensure stable switching performance of inductive loads.

Schematic

Package Outlines

Absolute Maximum Ratings ($T_A = 25^\circ\text{C}$ unless otherwise specified.)

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameters	Value	Units
TOTAL DEVICE			
T _{STG}	Storage Temperature	-40 to +150	°C
T _{OPR}	Operating Temperature	-40 to +85	°C
T _{SOL}	Lead Solder Temperature (Wave Solder)	260 for 10 sec	°C
T _J	Junction Temperature Range	-40 to +100	°C
V _{ISO}	Isolation Surge Voltage ⁽¹⁾ (peak AC voltage, 60Hz, 1 sec. duration)	7500	Vac(pk)
P _D	Total Device Power Dissipation @ 25°C Derate above 25°C	330	mW
		4.4	mW/°C
EMITTER			
I _F	Continuous Forward Current	60	mA
V _R	Reverse Voltage	3	V
P _D	Total Device Power Dissipation @ 25°C Derate above 25°C	100	mW
		1.33	mW/°C
DETECTOR			
V _{DRM}	Off-State Output Terminal Voltage	600	V
I _{TSM}	Peak Repetitive Surge Current (PW = 100μs, 120pps)	1	A
P _D	Total Power Dissipation @ 25°C Ambient Derate above 25°C	300	mW
		4	mW/°C

Note:

1. Isolation surge voltage, V_{ISO} , is an internal device breakdown rating. For this text, pins 1 and 2 are common, and pins 4, 5 and 6 are common.

Electrical Characteristics ($T_A = 25^\circ\text{C}$ unless otherwise specified.)**Individual Component Characteristics**

Symbol	Parameters	Test Conditions	Min.	Typ.*	Max.	Units
EMITTER						
V_F	Input Forward Voltage	$I_F = 10\text{mA}$		1.18	1.5	V
I_R	Reverse Leakage Current	$V_R = 3\text{V}$		0.05	100	μA
DETECTOR						
I_{DRM}	Peak Blocking Current, Either Direction	$V_{\text{DRM}}, I_F = 0^{(2)}$		10	100	nA
V_{TM}	Peak On-State Voltage, Either Direction	$I_{\text{TM}} = 100\text{mA peak}, I_F = 0$		1.7	2.5	V
dv/dt	Critical Rate of Rise of Off-State Voltage	$I_F = 0$ (Figure 7, @ 400V)	1000			V/ μs

Transfer Characteristics

Symbol	DC Characteristics	Test Conditions	Device	Min.	Typ.*	Max.	Units
I_{FT}	LED Trigger Current, Either Direction	Main terminal Voltage = $3\text{V}^{(3)}$	MOC3051M			15	mA
			MOC3052M			10	
I_H	Holding Current, Either Direction		All		220		μA

Isolation Characteristics

Symbol	Characteristic	Test Conditions	Min.	Typ.*	Max.	Units
V_{ISO}	Input-Output Isolation Voltage	$f = 60\text{Hz}, t = 1 \text{ sec.}$	7500			Vac(pk)
R_{ISO}	Isolation Resistance	$V_{\text{I-O}} = 500\text{VDC}$		10^{11}		Ω
C_{ISO}	Isolation Capacitance	$V = 0\text{V}, f = 1\text{MHz}$		0.2		pF

*Typical values at $T_A = 25^\circ\text{C}$ **Notes:**

- Test voltage must be applied within dv/dt rating.
- All devices are guaranteed to trigger at an I_F value less than or equal to max I_{FT} . Therefore, recommended operating I_F lies between max. 15A for MOC3051M, 10mA for MOC3052M and absolute max. I_F (60mA).

Safety and Insulation Ratings

As per IEC 60747-5-2, this optocoupler is suitable for “safe electrical insulation” only within the safety limit data. Compliance with the safety ratings shall be ensured by means of protective circuits.

Symbol	Parameter	Min.	Typ.	Max.	Unit
	Installation Classifications per DIN VDE 0110/1.89 Table 1				
	For Rated Main Voltage < 150Vrms		I-IV		
	For Rated Main voltage < 300Vrms		I-IV		
	Climatic Classification		55/100/21		
	Pollution Degree (DIN VDE 0110/1.89)		2		
CTI	Comparative Tracking Index	175			
V_{PR}	Input to Output Test Voltage, Method b, $V_{IORM} \times 1.875 = V_{PR}$, 100% Production Test with $t_m = 1$ sec, Partial Discharge < 5pC	1594			V_{peak}
	Input to Output Test Voltage, Method a, $V_{IORM} \times 1.5 = V_{PR}$, Type and Sample Test with $t_m = 60$ sec, Partial Discharge < 5pC	1275			V_{peak}
V_{IORM}	Max. Working Insulation Voltage	850			V_{peak}
V_{IOTM}	Highest Allowable Over Voltage	6000			V_{peak}
	External Creepage	7			mm
	External Clearance	7			mm
	Insulation Thickness	0.5			mm
RIO	Insulation Resistance at T_s , $V_{IO} = 500V$	10^9			Ω

Typical Performance Curves

Figure 1. LED Forward Voltage vs. Forward Current

Figure 2. On-State Characteristics

Figure 3. Trigger Current vs. Ambient Temperature

Figure 4. LED Current Required to Trigger vs. LED Pulse Width

I_F vs. Temperature (normalized)

Figure 3 shows the increase of the trigger current when the device is expected to operate at an ambient temperature below 25°C. Multiply the normalized I_{FT} shown this graph with the data sheet guaranteed I_{FT} .

Example:

$T_A = -40^\circ\text{C}$, $I_{FT} = 10\text{ mA}$

$I_{FT} @ -40^\circ\text{C} = 10\text{ mA} \times 1.4 = 14\text{ mA}$

Phase Control Considerations

LED Trigger Current versus PW (normalized)

Random Phase Triac drivers are designed to be phase controllable. They may be triggered at any phase angle within the AC sine wave. Phase control may be accomplished by an AC line zero cross detector and a variable pulse delay generator which is synchronized to the zero

cross detector. The same task can be accomplished by a microprocessor which is synchronized to the AC zero crossing. The phase controlled trigger current may be a very short pulse which saves energy delivered to the input LED. LED trigger pulse currents shorter than 100μs must have an increased amplitude as shown on Figure 4. This graph shows the dependency of the trigger current I_{FT} versus the pulse width can be seen on the chart delay $t(d)$ versus the LED trigger current.

I_{FT} in the graph I_{FT} versus (PW) is normalized in respect to the minimum specified I_{FT} for static condition, which is specified in the device characteristic. The normalized I_{FT} has to be multiplied with the devices guaranteed static trigger current.

Example:

Guaranteed $I_{FT} = 10\text{ mA}$, Trigger pulse width $PW = 3\mu\text{s}$

$I_{FT}(\text{pulsed}) = 10\text{ mA} \times 5 = 50\text{ mA}$

Minimum LED Off Time in Phase Control Applications

In Phase control applications one intends to be able to control each AC sine half wave from 0° to 180° . Turn on at 0° means full power and turn on at 180° means zero power. This is not quite possible in reality because triac driver and triac have a fixed turn on time when activated at zero degrees. At a phase control angle close to 180° the driver's turn on pulse at the trailing edge of the AC sine wave must be limited to end 200ms before AC zero cross as shown in Figure 5. This assures that the triac driver has time to switch off. Shorter times may cause loss of control at the following half cycle.

I_{FT} versus dv/dt

Triac drivers with good noise immunity (dv/dt static) have internal noise rejection circuits which prevent false

triggering of the device in the event of fast raising line voltage transients. Inductive loads generate a commutating dv/dt that may activate the triac drivers noise suppression circuits. This prevents the device from turning on at its specified trigger current. It will in this case go into the mode of "half waving" of the load. Half waving of the load may destroy the power triac and the load.

Figure 8 shows the dependency of the triac drivers I_{FT} versus the reapplied voltage rise with a V_p of 400V. This dv/dt condition simulates a worst case commutating dv/dt amplitude.

It can be seen that the I_{FT} does not change until a commutating dv/dt reaches 1000V/ms. The data sheet specified I_{FT} is therefore applicable for all practical inductive loads and load factors.

Figure 5. Minimum Time for LED Turn-Off to Zero Cross of AC Trailing Edge

Figure 7 Leakage Current, I_{DRM} vs. Temperature

Figure 6 Holding Current, I_H vs. Temperature

Figure 8 LED Trigger Current, I_{FT} vs. dv/dt

t(delay), t(f) versus I_{FT}

The triac driver's turn on switching speed consists of a turn on delay time $t(d)$ and a fall time $t(f)$. Figure 9 shows that the delay time depends on the LED trigger current, while the actual trigger transition time $t(f)$ stays constant with about one micro second.

The delay time is important in very short pulsed operation because it demands a higher trigger current at very short trigger pulses. This dependency is shown in the graph I_{FT} vs. LED PW.

The turn on transition time $t(f)$ combined with the power triac's turn on time is important to the power dissipation of this device.

Figure 9. Delay Time, $t(d)$, and Fall Time, $t(f)$, vs. LED Trigger Current

1. The mercury wetted relay provides a high speed repeated pulse to the D.U.T.
2. 100x scope probes are used, to allow high speeds and voltages.
3. The worst-case condition for static dv/dt is established by triggering the D.U.T. with a normal LED input current, then removing the current. The variable R_{TEST} allows the dv/dt to be gradually increased until the D.U.T. continues to trigger in response to the applied voltage pulse, even after the LED current has been removed. The dv/dt is then decreased until the D.U.T. stops triggering. τ_{RC} is measured at this point and recorded.

Figure 10. Static dv/dt Test Circuit

Applications Guide

Basic Triac Driver Circuit

The new random phase triac driver family MOC3052M and MOC3051M are very immune to static dv/dt which allows snubberless operations in all applications where external generated noise in the AC line is below its guaranteed dv/dt withstand capability. For these applications a snubber circuit is not necessary when a noise insensitive power triac is used. Figure 11 shows the circuit diagram. The triac driver is directly connected to the triac main terminal 2 and a series Resistor R which limits the current to the triac driver. Current limiting resistor R must have a minimum value which restricts the current into the driver to maximum 1A.

$$R = V_p AC / I_{TM} \text{ max rep.} = V_p AC / 1A$$

The power dissipation of this current limiting resistor and the triac driver is very small because the power triac carries the load current as soon as the current through driver and current limiting resistor reaches the trigger current of the power triac. The switching transition times for the driver is only one micro second and for power triacs typical four micro seconds.

Figure 11. Basic Driver Circuit

Triac Driver Circuit for Noisy Environments

When the transient rate of rise and amplitude are expected to exceed the power triacs and triac drivers maximum ratings a snubber circuit as shown in Figure 12 is recommended. Fast transients are slowed by the R-C snubber and excessive amplitudes are clipped by the Metal Oxide Varistor MOV.

Triac Driver Circuit for Extremely Noisy Environments

As specified in the noise standards IEEE472 and IEC255-4.

Industrial control applications do specify a maximum transient noise dv/dt and peak voltage which is superimposed onto the AC line voltage. In order to pass this environment noise test a modified snubber network as shown in Figure 13 is recommended.

Recommended Pad Layout for Surface Mount Leadform

Note:

All dimensions are in inches (millimeters).

Ordering Information

Option	Order Entry Identifier (Example)	Description
No option	MOC3051M	Standard Through Hole Device
S	MOC3051SM	Surface Mount Lead Bend
SR2	MOC3051SR2M	Surface Mount; Tape and Reel
T	MOC3051TM	0.4" Lead Spacing
V	MOC3051VM	VDE 0884
TV	MOC3051TVM	VDE 0884, 0.4" Lead Spacing
SV	MOC3051SVM	VDE 0884, Surface Mount
SR2V	MOC3051SR2VM	VDE 0884, Surface Mount, Tape and Reel

Marking Information

Definitions	
1	Fairchild logo
2	Device number
3	VDE mark (Note: Only appears on parts ordered with VDE option – See order entry table)
4	One digit year code, e.g., '3'
5	Two digit work week ranging from '01' to '53'
6	Assembly package code

*Note – Parts that do not have the 'V' option (see definition 3 above) that are marked with date code '325' or earlier are marked in portrait format.

Tape Dimensions

Note:

All dimensions are in millimeters.

Reflow Profile

Profile Feature	Pb-Free Assembly Profile
Temperature Min. (T _{smin})	150°C
Temperature Max. (T _{smax})	200°C
Time (t _s) from (T _{smin} to T _{smax})	60–120 seconds
Ramp-up Rate (t _L to t _p)	3°C/second max.
Liquidous Temperature (T _L)	217°C
Time (t _L) Maintained Above (T _L)	60–150 seconds
Peak Body Package Temperature	260°C +0°C / -5°C
Time (t _p) within 5°C of 260°C	30 seconds
Ramp-down Rate (T _p to T _L)	6°C/second max.
Time 25°C to Peak Temperature	8 minutes max.
